

AMENDMENTS TO THE ABSTRACT

The amended Abstract has been supplied on a separate sheet in the APPENDIX.

Abstract Of The Disclosure

A blister (10) for pharmaceutical products, diagnostic reagents or medical implements includes a blister bottom part (12). It is thermoformed from plastic, of a covering foil (16) made of aluminum or of an aluminum/plastic composite, and includes an undersealing trough (18), sealed against the rear side of the blister bottom part (12), which is cold-formed from an aluminum/plastic composite film. The aluminum/plastic composite film of the undersealing trough (18) includes, on the side oriented toward the blister bottom part (12), a peelable heat-sealable layer that includes a paint, a peelable plastic film or a peelable plastic coating. The undersealing trough (18) that can be removed from the blister bottom part (12) by peeling permits the product contained inside of the blister (10) to be seen. The bottom part plastic is a barrier against water vapor and/or gasses.
